

I have read technical reports from a number of sources (RSGB EMC Committee, ARRL, US govt.) concerning the use of BPL or PLT. I am very concerned about the perceived "non-interference" issue as stated by the broadband industry. From all reports and results from test sights, the interference to the spectrum from 2-30Mhz is very severe indeed. As a amateur radio operator for over 42 years, I am very concerned about the hazard of BPL to my hobby. There is no need to mention all the good that amateur radio has done over the years as far as disaster communications, new electronic innovations, and education has provided. Please, be very careful in studying ALL aspects of BPL and how destructive it would be to worldwide communications in the 2-80Mhz spectrum. Thank you for your time...
